

# Libft A tua primeira biblioteca

#### Sumário:

Este projeto consiste em programar uma biblioteca em C . Vai conter muitas funções que vais usar nos teus programas futuros

Versão: 16.1

## Conteúdos

I. Introdução	2
II. Instruções gerais	3
III. Parte Obrigatória III.1 Considerações Técnicas 5 III.2 Funções da LibC 6 III.3 Funções adicionais 7	5
IV. Parte bônus	
V. Entrega e avaliação	15

## Capítulo I Introdução

C programming can be very tedious when one doesn't have access to the highly useful

standard functions. This project is about understanding the way these functions work,

implementing and learning to use them. Your will create your own library. It will bake the time to expand your libft throughout the year. However, when helpforksimge you will use it in your next Cschool assignments. on a new project, don't forget to ensure the functions used in your library are allowed in the project guidelines.

### Chapter II

#### **Common Instructions**

•	Your	project	must b	e written	in C.
---	------	---------	--------	-----------	-------

 Your project must be written in accordance with the Norm. If you have bonus

files/functions, they are included in the norm check and you will receive

a 0 if there

Your functions should not quit unexpectedly (segmentation fault, bus error, double

free, etc) apart from undefined behaviors. If this happens, your project will be

All heap allocated memory and will receive properly free hyper evaluation.
 necessary. No leaks

will be tolerated.

If the subject requires it, you must submit a

Makefile which will compile your

source files to the required output with the flags

-Wall, -Wextra and -Werror . use

- Your Makefile must rontain the rules \$(NAME), all, clean, fclean and
- re.
   To turn in bonuses to your project, you must include a rule bonus to your Makefile,

which will add all the various headers, librairies or functions that are forbidden on

the main part of the project. Bonuses must be in a different file bonus.{c/h} if

• โก้ยรูปเตียงคือ อีโดงหรือ มีครามารถ เลือง เก็บสามารถ เก็บสามารถาน เก็บสามารถ เก็บสามารถาน เก็บสามารถ เก็บสามารถสามารถ เก็บสามารถ เก็บส

associated Makefile in a libft folder with its associated Makefile. Your project's

Make file of the file that by our make file even though lile the this work project

won't have to be submitted and won't be graded chance

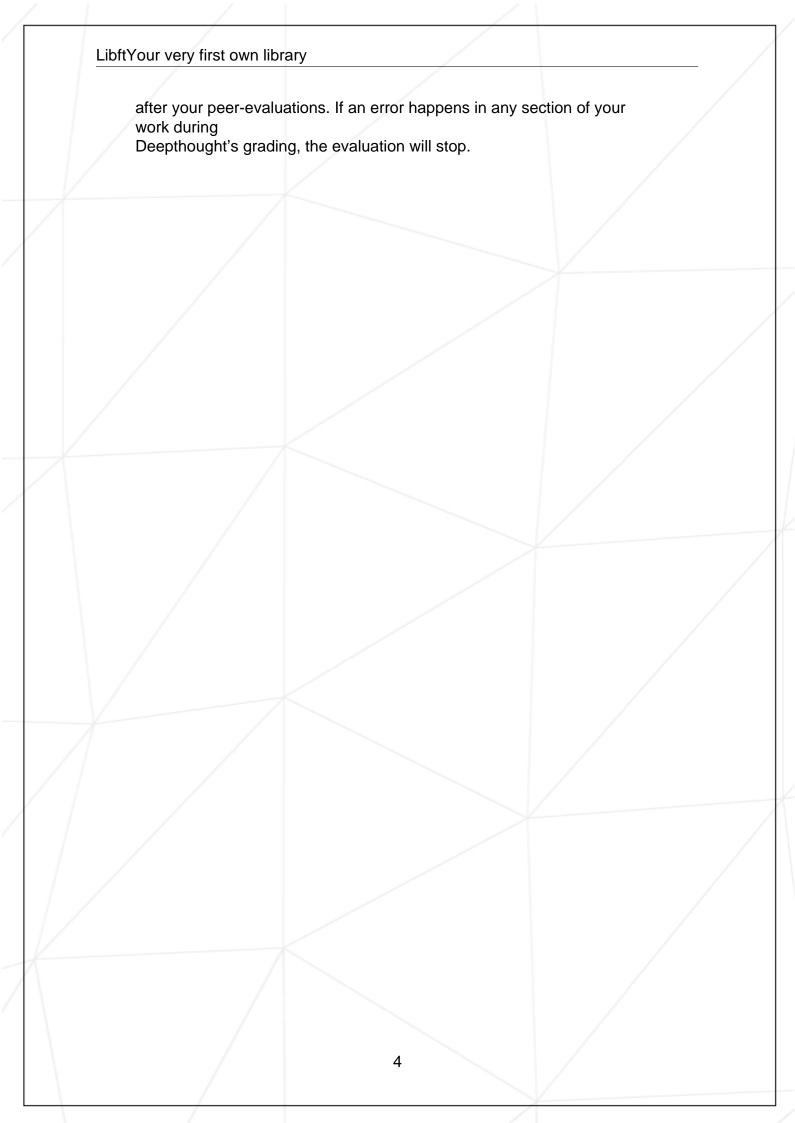

. It will give you a

to easily test your work and your peers' work. You will find those tests especially

Submitachtayorktayercesniqued, pituring siterence, nyothare ortein these git venneists

atorx will be graded her peep thought is assigned to grade your work, it

will be done

# Chapter III Mandatory part

Program name	libft.a	
Turn in files	Makefile, libft.h, ft_*.c	
Makefile	NAME, all, clean, fclean, re	
External functs.	Detailed below	
Libft authorized	n/a	
Description	Write your own library:a collection of functions	
/	that will be a useful tool for your cursus.	

#### III.1Technical considerations

- Declaring global variables is forbidden.
- If you need helper functions to split a more complex function, define them as static
- functions. This way, their scope will be limited to the appropriate file.

   Place all your files at the root of your repository.
- Turning in unused files is forbidden.
- Every .c files must compile with the flags -Wall -Wextra -Werror .
- You must use the command ar to create your library. Using the libtool command
- is forbidden.Your libft.a has to be created at the root of your repository.

#### III.2Part 1 - Libc functions

To begin, you must redo a set of functions from the libc . Your functions will have the

same prototypes and implement the same behaviors as the originals. They must comply

with the way they are defined in their man . The only difference will be their

Some of the functions' prototypes you have to redo use the 'restrict' qualifier. This keyword is part of the c99 standard. It is therefore forbidden to include it in your own prototypes and to compile your code with the -std=c99 flag.

You must write your own function implementing the following original ones. They do not require any external functions:

• isalpha

isaipiieisdigit

isalnum

isascii

isprint

strlen

memset

bzero

memcpy

memmove

strlcpy

strlcat

• toupper

tolower

• strchr

strrchr

strncmp

memchr

memcmp

strnstr

atoi

In order to implement the two following functions, you will use

malloc():

calloc

strdup

#### III.3Part 2 - Additional functions

In this second part, you must develop a set of functions that are either not in the  $\,\mbox{libc}$  ,

or that are part of it but in a different form.

Some of the following functions can be useful for writing the functions of Part 1.

Function name	ft_substr	
Prototype	char *ft_substr(char const *s, unsigned int start,	
/	size_t len);	
Turn in files	- /	
Parameters	s:The string from which to create the substring.	
	start:The start index of the substring in the	
	string 's'.	
	len:The maximum length of the substring.	
Return value	The substring.	
/	NULL if the allocation fails.	
External functs.	malloc	
Description	Allocates (with malloc(3)) and returns a substring	
	from the string 's'.	
	The substring begins at index 'start' and is of	
	maximum size 'len'.	

Function name	ft_strjoin	
Prototype	char *ft_strjoin(char const *s1, char const *s2);	
Turn in files		
Parameters	s1:The prefix string.	
	s2:The suffix string.	
Return value	The new string.	
	NULL if the allocation fails.	
External functs.	malloc	
Description	Allocates (with malloc(3)) and returns a new	
	string, which is the result of the concatenation	
	of 's1' and 's2'.	

Function name	ft_strtrim	
Prototype	char *ft_strtrim(char const *s1, char const *set);	
Turn in files	- /	
Parameters	s1:The string to be trimmed.	
	set:The reference set of characters to trim.	
Return value	The trimmed string.	
/	NULL if the allocation fails.	
External functs.	malloc	
Description	Allocates (with malloc(3)) and returns a copy of	
	's1' with the characters specified in 'set' removed	
	from the beginning and the end of the string.	

Function name	ft_split	
Prototype	char **ft_split(char const *s, char c);	
Turn in files	- /	
Parameters	s:The string to be split. c:The delimiter character.	
Return value	The array of new strings resulting from the split.  NULL if the allocation fails.	
External functs.	malloc, free	
Description	Allocates (with malloc(3)) and returns an array of strings obtained by splitting 's' using the character 'c' as a delimiter. The array must end with a NULL pointer.	

Function name	ft_itoa	
Prototype	char *ft_itoa(int n);	
Turn in files	1-/	
Parameters	n:the integer to convert.	
Return value	The string representing the integer.  NULL if the allocation fails.	
External functs.	malloc	
Description	Allocates (with malloc(3)) and returns a string representing the integer received as an argument.  Negative numbers must be handled.	

Function name	ft_strmapi
Prototype	char *ft_strmapi(char const *s, char (*f)(unsigned
	int, char));
Turn in files	-/
Parameters	s:The string on which to iterate.
	f:The function to apply to each character.
Return value	The string created from the successive applications
	of 'f'.
	Returns NULL if the allocation fails.
External functs.	malloc
Description	Applies the function f to each character of the
	string s, passing its index as the first argument
	and the character itself as the second. A new
	string is created (using malloc(3)) to collect the
	results from the successive applications of f.

Function name	ft_striteri
Prototype	<pre>void ft_striteri(char *s, void (*f)(unsigned int,</pre>
Turn in files	-
Parameters	s:The string on which to iterate. f:The function to apply to each character.
Return value	None
External functs.	None
Description	Applies the function 'f' on each character of the string passed as argument, passing its index as first argument. Each character is passed by address to 'f' to be modified if necessary.

Function name	ft_putchar_fd
Prototype	void ft_putchar_fd(char c, int fd);
Turn in files	-
Parameters	c:The character to output.
	fd:The file descriptor on which to write.
Return value	None
External functs.	write
Description	Outputs the character 'c' to the given file
	descriptor.

Function name	ft_putstr_fd
Prototype	void ft_putstr_fd(char *s, int fd);
Turn in files	- /
Parameters	s:The string to output. fd:The file descriptor on which to write.
Return value	None
External functs.	write
Description	Outputs the string 's' to the given file descriptor.

Function name	ft_putendl_fd
Prototype	void ft_putendl_fd(char *s, int fd);
Turn in files	- / /
Parameters	s:The string to output.
	fd:The file descriptor on which to write.
Return value	None
External functs.	write
Description	Outputs the string 's' to the given file descriptor
/	followed by a newline.

Function name	ft_putnbr_fd	
Prototype	void ft_putnbr_fd(int n, int fd);	
Turn in files		
Parameters	n:The integer to output.	/
	fd:The file descriptor on which to write.	
Return value	None	/
External functs.	write	/
Description	Outputs the integer 'n' to the given file descriptor.	

### Chapter IV

### **Bonus part**

If you completed the mandatory part, do not hesitate to go further by doing this extra

one. It will bring bonus points if passed successfully.

Functions to manipulate memory and strings is very useful. But you will soon discover

that manipulating lists is even more useful.

You have to use the following structure to represent a node of your list.

Add its

declaration to your / libft.h file:

The members of the t\_list struct are:

• content : The data contained in the node.

void \* allows to store any kind of

• ndaxta: The address of the next node, or NULL if the next node is the last one.

In your Makefile, add a make bonus rule to add the bonus functions to your

libft.a

The bonus part will only be assessed if the mandatory part is PERFECT. Perfect means the mandatory part has been integrally done and works without malfunctioning. If you have not passed ALL the mandatory requirements, your bonus part will not be evaluated at all.

Implement the following functions in order to easily use your lists.

Function name	ft_lstnew
Prototype	t_list *ft_lstnew(void *content);
Turn in files	/I-
Parameters	content:The content to create the node with.
Return value	The new node
External functs.	malloc
Description	Allocates (with malloc(3)) and returns a new node. The member variable 'content' is initialized with the value of the parameter 'content'. The variable 'next' is initialized to NULL.

Function name	ft_lstadd_front
Prototype	<pre>void ft_lstadd_front(t_list **lst, t_list *new);</pre>
Turn in files	
Parameters	Ist:The address of a pointer to the first link of a list. new:The address of a pointer to the node to be added to the list.
Return value	None
External functs.	None
Description	Adds the node 'new' at the beginning of the list.

Function name	ft_lstsize	
Prototype	int ft_lstsize(t_list *lst);	/
Turn in files	1./	/
Parameters	lst:The beginning of the list.	/
Return value	The length of the list	/
External functs.	None	
Description	Counts the number of nodes in a list.	/

Function name	ft_lstlast	
Prototype	t_list *ft_lstlast(t_list *lst);	
Turn in files	1.	
Parameters	lst:The beginning of the list.	/
Return value	Last node of the list	
External functs.	None	/
Description	Returns the last node of the list.	/

Function name	ft_lstadd_back	
Prototype	<pre>void ft_lstadd_back(t_list **lst, t_list *new);</pre>	
Turn in files	- /	
Parameters	Ist:The address of a pointer to the first link of a list.	
/	new:The address of a pointer to the node to be added to the list.	
Return value	None	
External functs.	None	
Description	Adds the node 'new' at the end of the list.	

Function name	ft_lstdelone
Prototype	void ft_lstdelone(t_list *lst, void (*del)(void
/	*));
Turn in files	- /
Parameters	Ist:The node to free.
	del:The address of the function used to delete
	the content.
Return value	None
External functs.	free
Description	Takes as a parameter a node and frees the memory of
	the node's content using the function 'del' given
/	as a parameter and free the node. The memory of
	'next' must not be freed.

Function name	ft_lstclear	
Prototype	<pre>void ft_lstclear(t_list **lst, void (*del)(void *));</pre>	
Turn in files	-K-	
Parameters	Ist:The address of a pointer to a node. del:The address of the function used to delete the content of the node.	
Return value	None	
External functs.	free	
Description	Deletes and frees the given node and every successor of that node, using the function 'del' and free(3). Finally, the pointer to the list must be set to NULL.	/

Function name	ft_lstiter
Prototype	void ft_lstiter(t_list *lst, void (*f)(void *));
Turn in files	- /
Parameters	Ist:The address of a pointer to a node.
	f:The address of the function used to iterate on
	the list.
Return value	None
External functs.	None
Description	Iterates the list 'Ist' and applies the function
	'f' on the content of each node.

Function name	ft_lstmap
Prototype	t_list *ft_lstmap(t_list *lst, void *(*f)(void *), void (*del)(void *));
Turn in files	- /
Parameters	Ist:The address of a pointer to a node. f:The address of the function used to iterate on the list. del:The address of the function used to delete the content of a node if needed.
Return value	The new list. NULL if the allocation fails.
External functs.	malloc, free
Description	Iterates the list 'Ist' and applies the function 'f' on the content of each node.Creates a new list resulting of the successive applications of the function 'f'.The 'del' function is used to delete the content of a node if needed.

# Chapter V Submission and peer-evaluation

Turn in your assignment in your Git repository as usual. Only the work inside your repos-

itory will be evaluated during the defense. Don't hesitate to double check the names of

you Place to go sunder the content your repository.
